

ALLIANZIM QUARTERLY BUFFERED ETFs

Realize outcomes faster with quarterly resets

A lot can change in a year. Built to reset every 3 months, the AllianzIM Quarterly Buffered ETF suite gives you a more responsive approach to defined outcome investing across U.S. large caps, small caps, and international equities.

At the end of each quarterly outcome period, the fund resets with a fresh buffer and cap to keep you aligned with market opportunities.

Buffer: 5% or 15% level of downside loss the ETF seeks to absorb over the outcome period.

Cap: Maximum potential return the ETF seeks to provide for the outcome period.

Outcome Period: 3-month timeframe during which the fund seeks to deliver its stated buffer and cap.

Reference Asset: 1:1 upside exposure to the S&P 500®, Nasdaq-100®, Russell 2000®, or MSCI EAFE®.

BENEFITS OF QUARTERLY BUFFERED ETFs

- Single tickers for easy implementation into existing portfolios or models
- Known levels of downside protection across popular market exposures
- Quarterly resets to help you stay aligned with shifting markets
- Tax-efficient, liquid, and transparent

Buffer and cap subject to fees and expenses.

Fitting quarterly buffered ETFs into a portfolio

A more streamlined way to manage risk. Quarterly buffers refresh your downside protection and upside exposure four times a year, which means there's no need for manual oversight or juggling multiple individual buffer positions.

Choose your protection level. Choose between 5% and 15% buffers (subject to fees and expenses) to align risk mitigation with your goals across major equity exposures. Quarterly resets help you capture progress and refresh protection levels more frequently.

Redefining portfolio balance. Quarterly buffered ETFs can play a flexible role within asset allocation, complementing equity sleeves or serving as an alternative to traditional conservative exposures. Additionally, these quarterly resetting funds may provide tax efficiencies relative to fixed income, depending on holding period and outcomes.

- Quarterly 5% buffers can complement or serve as a flexible alternative to a portfolio's moderate equity sleeve or one-year buffer allocation. They seek a measured level of downside protection with more frequent reset opportunities.
- Quarterly 15% buffers could be used alongside, or in place of, conservative equity and fixed income exposures. They can help dampen interest-rate and credit risk while offering equity upside potential, to a cap.

How do quarterly buffered ETFs work?

In down markets: AllianzIM Quarterly Buffered ETFs seek to absorb the first 5% or 15% of the reference asset's losses over the 3-month outcome period.

In up markets: If the underlying ETF's value increases, the ETF seeks to track those returns to a predetermined cap set at the beginning of the outcome period.

Reset mechanism: Outcome periods reset at the end of each calendar quarter with a new cap and fresh buffer.

The Buffered ETFs' investment strategies are different from more typical investment products, and the Funds may be unsuitable for some investors. It is important that investors understand the investment strategy before making an investment. For more information regarding whether an investment in the Funds is right for you, please see the prospectus including "Investor Considerations." There is no guarantee the Funds will achieve their investment objectives.

FLEX Options Risk: The Fund will utilize FLEX Options issued and guaranteed for settlement by the Options Clearing Corporation ("OCC"). The Fund bears the risk that the OCC will be unable or unwilling to perform its obligations under the FLEX Options contracts. In the unlikely event that the OCC becomes insolvent or is otherwise unable to meet its settlement obligations, the Fund could suffer significant losses.

FLEX Options are customized equity or index options contracts that trade on an exchange, but provide investors with the ability to customize key contract terms like exercise prices, styles, and expiration dates. An options contract is an agreement between a buyer and seller that gives the purchaser of the option the right, but not the obligation, to buy (in the case of a call option), or to sell (in the case of a put option), a particular asset at a specified future date at an agreed upon price (commonly known as the "strike price").

There is no guarantee that the outcomes sought for an Outcome Period will be realized, and there is no guarantee that the Buffer will limit Fund losses or that participation up to the Cap will be achieved. The outcomes that the Fund seeks to provide do not include the costs associated with purchasing shares of

the Fund or the Fund's annualized management fee. The Cap and Buffer will be further reduced by brokerage commissions, trading fees, taxes and non-routine or extraordinary expenses not included in the Fund's unitary management fee. To achieve the target outcomes sought by the Fund for an Outcome Period, an investor must hold Shares for that entire Outcome Period.

The Fund's website, www.allianzIMetfs.com, provides important Fund information (including outcome period start and end dates and the participation rate and buffer), as well as information relating to the potential outcomes of an investment in the Fund on a daily basis. If you are contemplating purchasing shares, please visit the website. Investors considering purchasing shares after the outcome period has begun or selling shares prior to the end of the outcome period should visit the website to fully understand potential investment outcomes.
